

Life Processes:

Draw/find a picture that demonstrates the life processes below. At least one has to be at the cellular level. Be sure to add color and do your best work.

<p style="text-align: center;">Digestion</p>	<p style="text-align: center;">Ingestion</p>
<p style="text-align: center;">Cellular Respiration</p>	<p style="text-align: center;">Regulation</p>
<p style="text-align: center;">Reproduction</p>	<p style="text-align: center;">Transport</p>
<p style="text-align: center;">Excretion</p>	<p style="text-align: center;">*Photosynthesis</p>

- Life Processes happen at the **cellular** level—each cell performs all of them and has a cell part responsible for doing each.
 - They also happen at the **organism** level—each multi-cellular organism will perform all the life processes and has one or two organ system responsible for each.
- *Photosynthesis does not happen in all living things...only plants and producers.
